THE INNOVATIVE DESIGN AND THE WIDE RANGE OF MODELS, COLORS AND MATERIALS ARE OUR RESPONSE TO THE GROWING NEEDS OF OUR CUSTOMERS FOR BETTER QUALITY.

Materials And Technological Lines

Composites are materials representing a combination of at least two or more different ingredients. By connecting chemically these elements create a new material with properties, completely different from those of the starting materials.

Cast Marble

Cast marble is a composite material with basic components natural marble dust - up to 80%, and polyester resin- 20%. The coverage of the products is a transparent acid-resistant gel-coat, extremely stable by treatment with aggressive chemical agents /except abrasives/, and therefore especially easy for cleaning due to its nonporous surface, which does not retain spottings.

Granixit

Granixit is a composite material similar to cast marble - a mixture of marble powder and polyester resin. In the coating from transparent sanitary gel-coat is added a specific material - artificial high-tech filler. This additional material is a combination of granules with high hardness and different sizes, variety of colors and strong resistance to UV rays. This special supplement gives a specific granite vision of the product and provides a higher resistance to physical and mechanical influences.

Fatgranit

FATGRANIT is a new, higher class composite material for kitchen sinks, expanding the product portfolio of the company. The FATGRANIT sinks are made of 80% natural quartz, which is the hardest component of the granite, and 20% resin, pigments and additives, providing the linkage of the granite particles. The combination of resistance and easy maintenance makes FATGRANIT the perfect material for kitchen sinks, combining functionality, aesthetics and durability.

INNOVATIVE DESIGN

ANTIBACTERIAL

EXCEPTIONAL QUALITY

Antibacterial Protection

The technology is based on the addition of silver ions to the surface of the product during the manufacturing process. Once applied, they provide permanently antibacterial protection.

The advantages of the silver ions technology:

The most important benefit of antimicrobial additives is that besides the provided protection, they do not change the characteristics of the products in which they are integrated. It cannot be washed out from the treated surfaces.

The antibacterial effect remains for life of the product.

Features of the FAT kitchen sinks

- Specific structure of the material that reduces the noise from the water falling in the bowl.
- High level of UV – resistance – the colors remain bright even by using the sink outdoor.
- Specific structure of the surface coating with high resistance of aggressive chemicals /except abrasives.
- The smooth and non-porous coating prevents the formation of stains and overlays and provides a quick and easy cleaning.
- Perfectly straight lines of the mounting surfaces.
- A deep bowl on all models.
- Pre-drilled holes for mixing battery or soap dispenser.
- A large variety of models and colors.
- A high-level antibacterial protection due to the adding of silver ions to the material during the production.
- High scratch - and impact resistance by FATGRANIT material.
